

Disclaimer

Please note that precast concrete products are subject to natural processes that may affect their appearance over time.

Color Dissolution

The color of concrete may fade when exposed to sunlight. This is a natural occurrence and should be expected with prolonged exposure.

Efflorescence

Efflorescence, a crystalline deposit, may develop on the surface of concrete products over time. This is a common phenomenon caused by natural reactions within the concrete and environmental factors.

Maintenance Recommendations

To mitigate these effects and ensure the longevity of your concrete coping:

1. **Dry Before Installation:** Ensure the concrete coping is completely dry before installation.
2. **Sealing:** It is essential to seal the concrete coping on all sides (top, bottom, length, and width) before installation.
3. **Reapplication:** Reapply the sealer every 3-5 years, depending on the quality of the sealer and the environmental conditions.

Proper maintenance will help preserve the appearance and durability of your precast concrete products.

Belcrete Studio warrants each Purchaser of its Product that the Product will conform to the physical and mechanical properties provided in the letter of the Specification or Specification Sheet issued by Belcrete Studio for or applicable to the time of sale. Belcrete Studio does not provide engineering or other professional advisory services regarding the use of installation of the Product.

It is responsibility of the purchaser to obtain such services from licensed professionals.
